5 EASY WAYS

to **SAVE** energy and money this winter

Install motion sensors or timers in places you might forget to shut off the lights.

Use your high-consumption appliances, such as washing machines and dishwashers, during off-peak hours.

Change your furnace filter every three months to help your furnace run more efficiently.

Use weatherstrip or caulking to seal gaps around windows and doors and keep warm air in and cold air out.

Use a programmable thermostat and set it to 20°C (68°F) when you are home and 18°C (64°F) when you are sleeping or away to reduce heating costs by 20%.
